Chrome: Google's web version is useful, but still lacks some features after all these years. Toolbox for Google Play Store helps to fix a lot of minor problems to facilitate the use of your Apps.Toolbox, created by the Android police of the site, offers a ton of cogmill changes. In particular, in addition to the installation button, you will also see a button for the APK mirror. This site (which is also the property of Android Police) hosts APKs for apps that may not yet be loaded. This is particularly useful if you re-enacts extending an app that has not yet been oriented to everyone. See also the Aplain buttons (an alternative way to explore the game store) and the Android police cover for that app, if they exist. The extension will show you even if there is a beta version of an app available. Many companies perform beta programs for their apps to test new functionality before rolling to all, but you have to find them alone. This extension will now show you a Handy Link where you can register for the beta version and immediately download the version of Bleeding Edge. You can deactivate any function of the toolbox individually. So if you don't know or don't care what apprebrain is, you can disable that button in the extension options. For now the extension is a nice naked bones, but the few features that it is pretty is practical.Toolbox for Google Play Store | Chrome Web Store through the Android police The selected binary distributions are provided to simplify the installation of the most complicated parts of BSOFTE. In particular, the support of the FFTW3 library and threading (OpenMP or Grand Central Dispatch) is included in distributions. In most cases bsoft has been compiled against TCL / TK 8.5. These distributions dislike in a directory called "bsoft" (it is not necessary to compile). To complete the installation, make sure that environmental variables are set correctly to indicate the BSOFTE programs and library. See below for the source code that can be completed on any Unix flavor. Old versions of old versions of bsoft are provided for those who have developed the code based on those. New versions The most recent versions than the current main release can be found here. These distributions are not necessarily completed and must be disattapped within an existing bsoft directory. Supported platforms Linux (I386 / I686, X86 64, PowerPC, Alpha, Itanium) Darwin or MacOSX (PowerPC, Intel) IRIX64 (SGI) Solaris (Sole) AIX (IBM) VMS OSF1 or Tru64 (Alpha) VMS (Alpha) Cygwin Nt (Windows NT) In principle the package could be completed on any UNIX-based operating system. Mac OS X requirements: Mac OS X default installations have not installed compilers. Download XCode from the Developer Apple website and install it before. Note that Mac OS X XCode versions must be combined with different operating systems: Mac OS X 10.4 (Tiger): Xcode 2.5 Mac OS X 10.5 (Leopard): Xcode 3 Mac OS X 10.6 (Snow Leopard): Xcode 3 Mac OS X 10.7 (Lion): Xcode 4 Mac OS X 10.8 (mountain lion): Xcode 4 Mac OS X 10.9 (Mavericks): Xcode 5 Mac OS X 10.10 (Yosemite): Xcode 6 Mac OS X (El Capitan): Xcode 7 Mac OS X 10.12 (Sierra): Xcode 8 Mac OS X 10.13 (Sierra): Xcode 10 The Z library: The inclusion of the BSOFTE PNG format requires the LIBZ for compression. The requested files are: /usr/include/zlib.h /usr/local/include/zlib.h /usr/lib/libz.* (like libz.ao libz.so) on some versions of Unix and VMS. libz could Don't be available, so it's è In the distribution and will be completed. TCL / TK: BSOFTE is mainly a command line package, with all the necessary code included in the package. However, from version 0.9, includes a TCL / TK interface and a TCL / TK / BSHOW script, useful for viewing images and some interactive manipulations (not available for VMS). The TCL / TK version must be 8.3 or higher. BSOFTE can be completed without TCL / TK (see below for details). On most UNIX boxes, TCL / TK headers and libraries are installed in / usr or / usr / local (search / ermr/include/tk.h or /usr/local/include/tk.h). Linux distributions generally have separate packages for Runtime versions and TCL / TK developer. Both must be installed to be able to use the BSHOW. The BSOFTE configuration script, BConf, tries to automatically find the TCL / TK headers. Make sure the TCL / TK version is 8.3 or higher. Make sure the "TCL" and "Wish" commands are in your route executable. XML: The default format for parameter files is the star format. These can also be written in an XML format, but requires the libxml2 library with its header files. Common positions for header files are in / usr / include / libxml2 and the library in / usr / lib. The source code for this library is not included in bsoft due to its pure dimension. Improvements These improvements are optional and can be included during compilation. OpenMP: Different bsoft operations were parallelized with OpenMP. Support for OpenMP was part of GCC as Version 4.2 and platforms such as Mac OS X (first 10.7) and Linux support it. Grand Central Dispatch: On Mac OS X 10.7 and then, the compiler has been changed to Clang that does not support OpenMP. In Stead, threading is made using Grand Central Dispatch. FFTW3: Due to the complexities in the new versions of FFTW (3.x), it is no longer included in the bsoft distribution. It should be filled in as a single precision floating point with support for OpenMP activated if parallel operations are also desired. Disabled.
