Network unlock application for android. How we monitor network connectivity for android application. Android monitor network traffic per application. Android application for stable network. Network signal booster application for android. Network application on android. Android application for social network. Network administrator android application.

To put it simply, network monitoring tracks the consumption of traffic on your mobile device using the built-in Android tools as well as third-party applications. Network monitoring is especially important for users who have limits on data usage as well as for internet connections while roaming. Android network monitor apps are designed for advanced users who want to control incoming and outgoing traffic on their phones and tablets. Such programs provide information on all Internet connections, services, and apps that utilize Internet traffic, and IP addresses they connect to. Monitoring software displays the amount of data sent and received during each connection. This data is useful for tracking suspicious network activity. Some applications can be configured to send notifications every time your phone establishes an Internet connection. If you are sensitive to mobile data usage you can set limits for specific periods (for example, per day). If you exceed those limits, monitoring apps can offer options for reducing traffic consumption. Network monitoring software will be a useful tool for users who want to keep the network activity of their gadget under control. With their help, you will be able to find out about apps that consume too much data or even detect intruders. 1. Fing - Network Tools The app allows seeing devices connected to a selected WiFi network, evaluating security risks, and even finding intruders. You can easily troubleshoot discovered issues and achieve a higher network performance. Fing provides detailed information about connected devices (device name, manufacturer, IP and MAC addresses, etc.), internet provider analyses, measurements on the network quality, bandwidth data usage, and so much more. 2. PingTools Network Utilities PingTools makes it possible to ping the network, get information about its configuration, detect ports and WiFi networks, check whois information, lookup IP addresses, DNS, etc. With PingTools, you can track the use of the network. It also features a wake-on network function. 3. WiFi Analyzer With WiFi Analyzer, you can analyze all the available WiFi networks and connect to the least congested ones. WiFi Analyzer comes complete with a signal assessing tool to help you measure your WiFi signal. 4. IP Tools - A simple Network Utility IP Tools is a feature-packed yet simple and easy-to-use app to configure and diagnose networks as well as improve their performance. It has a tremendous number of utilities such as LAN and port scanners, WiFi analyzers, IP calculators, DNS lookup, ping data, whois information, and much more. 5. NetCut This tool allows seeing all the devices connected to your WiFi network (including game consoles). If you spot an unauthorized connection you can cut such a user off with a single tap. The app also supplies a handy Netcut defender tool. 6. WiFi Password Recovery If you forgot your WiFi password and now you can't hook up to your network WiFi Password Recovery is exactly what you need. You can restore the passwords of all the networks you previously used. Please note that the app is not capable of detecting passwords of networks you've never looked up to. Also, to use this tool your phone has to be rooted. 7. Network Monitor Mini This app displays data related to your network in the notification tray. With a free version, you can see information on your connection speed and data rate. You are also able to customize the app's appearance. The pro-version supplies tools to normalize VPN/proxy traffic, show decimal places, adjust Kilo values, and much more. 8. Network Monitor This app works like diagnostic software to scan your network and identify possible problems. Network Monitor gathers data on the network type, your location, cell towers you connect to, the signal level, etc. 9. Network Connections The app allows seeing all the connections from (and to) your phone. Network Connections provides information on every connection (IP address, PTR, AS number, etc), the amount of data sent and received, and much more. You are able to see every app on your device that uses Internet traffic. The app will send you a notification every time apps attempt to establish an Internet connection. 10. 3G Watchdog - Data Usage The app is able to count every type of data usage (3G, 4G, WiFi, etc) and display it in a convenient way. 3G Watchdog demonstrates traffic used by every app on your device. You can see a net data usage with detailed information about traffic used for certain periods of time (today, per week, per month). You can export all data to the CSV file. With these Android network monitor solutions, you can easily see what apps use your network. You are able to disable those that consume too much traffic. However, what to do if you want to check the apps your kids use? Maybe they spend too much time on their phones when instead they should be studying or participating in real-life communications? There is a solution for you. Parental control apps will help you remotely monitor and control software your children employ on their devices. FamiSafe is one of the best tools to keep an eye on your little ones, and that is why: Besides the app monitoring and blocking function, FamiSafe supplies detailed information about browsing history (what sites your kids' visit, when what pages they go to) and allows blocking specific websites. If you are not sure what web resources to ban, you can blacklist a whole category of sites. FamiSafe keeps a database of sites by their content, so you can make inappropriate categories unavailable. Web Filtering & Blocker Location Tracking & Geo-fencing App Blocker & App Activity Tracker Screen Time Limit & Schedule Social Media Texts & Porn Images Monitoring With the help of FamiSafe, you can track your kids' locations in real-time and check the history of their locations as well. You are also able to configure geo-fences to prevent visiting specific places or receive information on time and date your children come and leave home, go to school, and visit other places. Screen Time feature provides reports on phone usage. You can disable a phone's functions by setting up screen times. They identify specific hours when a phone is not allowed to be used. The app makes it possible to join up with separate functions to achieve better performances. For instance, by combining geofencing with the app blocking feature you can block apps when your kids are located at specific places (such as at school). Android network monitor apps allow getting to know your network and your phone better to keep the data usage under control. You can also monitor your kids' activities with the FamiSafe parental app. It helps to make your kids' online journeys safer and takes a lot of stress out of your life. You can't always keep an eye on your little ones but with FamiSafe, you'll know they are in reliable hands. FamiSafe is available on the App Store and Google Play. Feel free to download it today and get an opportunity to test its wonderful functions within a generous 3-days trial period. FamiSafe understands the concerns of every parent, that's why we designed our product to allow you the peace of mind you've been longing for. Android lets your application connect to the internet or any other local network and allows you to perform network operations. A device can have various types of network connections. This chapter focuses on using either a Wi-Fi or a mobile network connection. Checking Network Connection Before you perform any network operations, you must first check that are you connected to that network or internet e.t.c. For this android provides ConnectivityManager class. You need to instantiate an object of this class by calling getSystemService() method. Its syntax is given below - ConnectivityManager check = (ConnectivityManager) this.getSystemService(Context.CONNECTIVITY_SERVICE); Once you instantiate the object of ConnectivityManager class, you can use getAllNetworkInfo method to get the information of all the networks. This method returns an array of NetworkInfo. So you have to receive it like this. NetworkInfo[] info = check.getAllNetworkInfo(); The last thing you need to do is to check Connected State of the network. Its syntax is given below - for (int i = 0; i
