Internal style sheet in css example. What is external style sheet in html. Use external style sheet in html. How to add internal style sheet in html. What is internal style sheet in html.

View Discussion Improve Article Save Article Like Article Cascading Style Sheet(CSS) is used to set the style in web pages that contain HTML elements. It sets the background color, font-size, font-family, color, ... etc property of elements on a web page. There are three types of CSS which are given below: Inline CSS, Internal or Embedded CSS, External CSS. Internal CSS: Inline CSS contains the CSS property in the body section attached with element is known as inline CSS. This kind of style is specified within an HTML tag using the style attribute. Example: `h1 { color: red; }` Output: Internal or Embedded CSS: This can be used when a single HTML document must be styled uniquely. The CSS rule set should be within the HTML file in the head section i.e the CSS is embedded within the HTML file. Example: `<style type="text/css"> h1 { color: red; } </style>` Output: External CSS: External CSS contains separate CSS file which contains only style property with the help of tag attributes (For example class, id, heading, ... etc). CSS property written in a separate file with .css extension and should be linked to the HTML document using link tag. This means that for each element, style can be set only once and that will be applied across web pages. Example: The file given below contains CSS property. This file save with .css extension. For Ex: `geeks.css body { background-color:powderblue; } .main { text-align:center; } .GFG { color:#009900; font-size:50px; font-weight:bold; } .geeks { font-style:bold; font-size:20px; }` A computer science portal for geeks Output: Properties of CSS: Inline CSS has the highest priority, then comes Internal/Embedded followed by External CSS which has the least priority. Multiple style sheets can be defined on one page. If for an HTML tag, styles are defined in multiple style sheets then the below order will be followed. As inline has the highest priority, any styles that are defined in the internal and external style sheets are overridden by inline styles. Internal or Embedded stands second in the priority list and overrides the styles in the external style sheet. External style sheets have the least priority. If there are no styles defined either in inline or internal style sheet then external style sheet rules are applied for the HTML tags. Supported Browser: Google Chrome, Internet Explorer, Firefox, Opera, Safari. CSS is the foundation of webpages, is used for webpage development by styling websites and web apps. You can learn CSS from the ground up by following this CSS Tutorial and CSS Examples. When a browser reads a style sheet, it will format the HTML document according to the information in the style sheet. Three Ways to Insert CSS There are three ways of inserting a style sheet: External CSS, Internal CSS, Inline CSS, External CSS. With an external style sheet, you can change the look of an entire website by changing just one file! Each HTML page must include a reference to the external style sheet file inside the element, inside the head section. External styles are defined within the element, inside the section of an HTML page: `h1 { background-color: lightblue; } h1 { color: navy; margin-left: 20px; }` Note: Do not add a space between the property value and the unit: Incorrect `(space): margin-left: 20 px;` Correct `(no space): margin-left: 20px;` Internal CSS An internal style sheet may be used if one single HTML page has a unique style. The internal style is defined inside the element, inside the head section. Internal styles are defined within the element, inside the section of an HTML page: `body { background-color: linen; } h1 { color: maroon; margin-left: 40px; }` This is a heading. This is a paragraph. Try it Yourself » An external style sheet can be written in any text editor, and must be saved with a .css extension. The external .css file should not contain any HTML tags. Here is how the "mystyle.css" file looks like: `body { background-color: powderblue; } h1 { color: blue; } p { color: red; }` Note: This is a heading. This is a paragraph. Try it Yourself » Tip: An inline style loses many of the advantages of a style sheet (by mixing content with presentation). Use this method sparingly. Multiple Style Sheets If some properties have been defined for the same selector (element) in different style sheets, the value from the last read style sheet will be used. Assume that an external style sheet has the following style for the element: `h1 { color: orange; }` Then, assume that an internal style sheet also has the following style for the element: `h1 { color: orange; }` Try it Yourself » However, if the internal style is defined before the link to the external style sheet, the elements will be "navy": `h1 { color: orange; }` Try it Yourself » Cascading Order What style will be used when there is more than one style specified for an HTML element? All the styles in a page will "cascade" into a new "virtual" style sheet by the following rules, where number one has the highest priority: Inline style (inside an HTML element) External and internal style sheets (in the head section) Browser default So, an inline style has the highest priority, and will override external and internal styles and browser defaults. Try it Yourself » Ever heard about W3Schools Spaces? Here you can create your own website, or save code snippets for later use, for free. Get started for free » * no credit card required CSS stands for Cascading Style Sheets. CSS saves a lot of work. It can control the layout of multiple web pages all at once. Manipulate Text Colors, Boxes What is CSS? Cascading Style Sheets (CSS) is used to format the layout of a webpage. With CSS, you can control the color, font, the spacing between elements, how elements are positioned and laid out, what background images or background colors are to be used, different displays for different devices and screen sizes, and much more! Tip: The word cascading means that a style applied to a parent element will also apply to all children elements within the parent. So, if you set the color of the body text to "blue", all headings, paragraphs, and other text elements within the body will also get the same color (unless you specify something else!) Using CSS CSS can be added to HTML documents in 3 ways: inline - by using the style attribute inside HTML elements Internal - by using an element in the section External - by using an element to link to an external CSS file The most common way to add CSS, is to keep the styles in external CSS files. However, in this tutorial we will use inline and internal styles, because this is easier to demonstrate, and easier for you to try it yourself. Inline CSS An inline CSS is used to apply a unique style to a single HTML element. An inline CSS uses the style attribute of an HTML element. The following example sets the text color of ALL the elements (on that page) to blue, and the text color of ALL the elements to red. In addition, the page will be displayed with a "powderblue" background color: `body {background-color: powderblue;} h1 {color: blue;} p {color: red;}` This is a heading. This is a paragraph. Try it Yourself » External CSS An external style sheet is used to define the style for many HTML pages. To use an external style sheet, add a link to it in the section of each HTML page: `<link rel="stylesheet" href="stylescore.css"/>` This is a heading. This is a paragraph. Try it Yourself » The external style sheet can be written in any text editor. The file must not contain any HTML code, and must be saved with a .css extension. Here is what the "styles.css" file looks like: `body { background-color: powderblue; } h1 { color: blue; } p { color: red; }` Tip: With an external style sheet, you can change the look of an entire web site, by changing one file! CSS Colors, Fonts and Sizes Here, we will demonstrate some commonly used CSS properties. You will learn more about them later. The CSS color property defines the text color to be used. The CSS font-family property defines the font to be used. Use of CSS color, font-family and font-size properties: `h1 { color: blue; font-family: verdana; font-size: 300%; } p { color: red; font-family: courier; font-size: 100%; }` This is a heading. This is a paragraph. Try it Yourself » CSS Border The CSS border property defines a border around an HTML element. CSS Tip: You can define a border for nearly all HTML elements. CSS Padding The CSS padding property defines a padding (space) between the text and the border. Use of CSS border and padding properties: `p { border: 2px solid powderblue; padding: 30px; }` Try it Yourself » CSS Margin The CSS margin property defines a margin (space) outside the border. Use of CSS border and margin properties: `p { border: 2px solid powderblue; margin: 50px; }` Try it Yourself » Link to External CSS External style sheets can be referenced with a full URL or with a path relative to the current web page. This example uses a full URL to link to a style sheet:
